```java
/** This demos the Scanner Class functions for Strings.
 *
 * @author: Mr. Dagler
 */

import java.util.Scanner;

public class StringInput
{
    public static void main(String[] args)
    {
        Scanner in = new Scanner(System.in);
        String address, firstName;
        int age;

        System.out.println("Enter your address: ");
        address = in.nextLine();

        System.out.println("Enter your First Name and Age: ");
        firstName = in.next();
        age = in.nextInt();

        System.out.println("Student Info:");
        System.out.println("   Name: [" + firstName + "], Age: [" + age
        + "]");
        System.out.println("   Address: [" + address + "]");
    }
}
```
